HYDROLOGIC-HYDRAULIC STUDY
FOR MONTE ARENAS
VEGA BAJA, PUERTO RICO

Casiano Ancalle, P.E.

January, 2005

I. INTRODUCTION

A housing development project named Monte Arenas is to be constructed in the Municipality of Vega Baja. The site is located at PR-155 and can be accessed from highway PR-645. The project consists on housing units, recreational facilities, and green areas.

According to the regulatory flood maps the area of the project is non-floodable. Three storm runoff watercourses run across the site. The development of the project will not affect neither of these watercourses but for roadway crossings.

It is expected that the development of the site will increase runoff. This increase has to be mitigated in compliance with the requirements of the Puerto Rico Planning Board Regulation No. 3.

Purpose of Study

The purpose of the study is to determine the flood levels and footprint for the watercourses crossing the site, and to size the watercourse crossing structures from which two are located at the project access road. In addition, as the development of the site will increase the peak runoff discharge, the study will quantify the increase and provide means for mitigating it according to the Puerto Rico's Planning Board Regulation No. 3.

Approach

The following steps have been undertaken throughout the study:

Hydrologic Analysis: The following parameters were determined for the hydrologic analysis: drainage areas, average soil curve number and runoff lag time. Based on these parameters, discharge for 100-years frequency storm was determined for existing and proposed condition. HEC-1 model was used. Discharges for more recurrent storm events such as: 2-, 10-, 25-, 50- and 100-years, were also determined.

Hydraulic Analysis: A hydraulic analysis was performed in order to estimate the water surface elevations for the three storm watercourses. Existing condition's water levels were determined first. Water levels considering the crossing structures were determined. Comparison of water elevations for both conditions would fall within the limits established by Regulation No. 13. The US Army Corps of Engineer's HECRAS computer model was used.

Mitigation Analysis: A mitigation analysis was made in order to counteract the impact of the proposed development. A mitigation pond was employed as a detention structure. HEC-1 model was used for the mitigation analysis. 2-, 10-, 25-, 50- and 100 frequency discharges were analyzed for mitigation.

Conclusions and recommendations were elaborated.

Authorization

Eng Luis Franqui on behalf Rio Piedras Housing Corp. authorized this study, under a contract signed with Eng. Casiano Ancalle, principal of CA Engineering.

II. BACKGROUND INFORMATION

Location

The project site is located at both sides of road PR-645 that branches to the south from state road PR-155, in Quebrada Arenas Ward, Municipality of Vega Baja. The approximate total area of the project is 172 acres. Figure 1 illustrates the project site location on the USGS Quadrangle. Figure 2 shows the development layout.

Topography

The topography of the site is uneven; and is characterized by sloping to several directions, mainly to the north and to the east and in direction to the watercourses. The eastern side of the site slopes toward the east. Ground elevations range from 200 to 115 meters (m.s.l.). See Figure 3.

Water Bodies

Two water bodies are related to the site. No flow records are available from them. The majority of the project's runoff discharges to these watercourses. The remaining runoff discharges to the watercourse located at the east of the site

Former Studies

No hydrologic-hydraulic studies for the area of the project have found during the information research. This study is original in its conception, and the results found are correspondent to the parameters adopted during the hydrologic and hydraulic simulation.

Field Information

Field data used in this study was taken from the topographic information provided by Eng. Luis

Franqui. Results obtained in this study are strictly based on this information. The topography is tied to mean sea level reference. This fieldwork is included in the pocket attached to the back cover of this study as Appendix H.

Study Level

This study is intended as an aid to the design engineer in the preparation of the construction drawings for the recommended structures. Figures, schematics and drawings must not be used as construction drawings. The design engineer must elaborate the construction drawings in agreements with the recommendations of this study.

III. HYDROLOGIC ANALYSIS

The computer program entitled Flood Hydrograph Package (HEC-1), developed by the U.S. Army Corps of Engineers [1990], was used for the performance of the hydrologic analysis. Using this program, the Unit Hydrograph method and the Runoff Curve Number (CN) method, both developed by the Soil Conservation Service (SCS), were applied to determine the design hydrograph. This was computed by a process of translating the rainfall excess into a runoff hydrograph known as convolution.

Peak discharges for 2-, 10-, 25-, 50- and 100-year storm frequency were estimated for the existing condition and proposed condition.

Drainage Areas

Seven drainage areas have been identified for the existing condition at the project site; they were labeled P1, P2, P3, P4, P5, P6 and P7, with six offsite areas E1, E2, E3A, E3B E4 and E5 as shown in Figure 4. At proposed condition, the runoff pattern has been kept by maintaining the drainage areas close to that of the existing condition; with the exception of area P4, which has been subdivided in P4A, P4B and P4C, as shown in Figure 5. The total area of the project site is approximately 171.82 acres.

Table 1 shows the drainage areas taken into account for the hydrologic analysis, for both existing and proposed condition.

Table 1
Drainage Areas

	Name	Area, acres	
		Existing	Proposed
Project Areas	P1	51.57	--
	P1A	--	31.63

	P1B	--	19.00
	P2	25.70	30.22
	P3	8.94	6.96
	P4	36.67	--
	P4A	--	14.46
	P4B	--	15.70
	P4C	--	9.50
	P5	14.31	11.36
	P6	16.91	11.57
	P7	17.72	21.41
Offsite Areas	E1	110.13	110.13
	E2	555.45	55.45
	E3A	20.63	20.63
	E3B	15.04	15.04
	E4	9.15	9.15
	E5	14.01	14.01

Curve Numbers

Curve numbers were estimated from the the SCS's Soil Maps, the project area and the offsite basins are mainly classified in 8 types: Colinas clay, Santa Clara clay, Juncal clay, Naranjo clay, Moca clay, Vega Alta sandy clay. Weighted curve numbers were found for each individual drainage area. A CN value of 95 was assumed for the developed project site.

Appendix A includes the Curve Number computations for existing and proposed condition. Figure 6 shows the soil map corresponding to the project site and offsite areas.

Lag Time

The Lag Time (T_{Lag}) was estimated using the SCS method defined as:

$$T_{Lag} = \frac{L^{0.8}(S+1)^{0.7}}{1900\ Y^{0.5}}$$

where : L = channel length (ft)

S = 1000/CN - 10

Y = average watershed slope

Detailed Lag Time calculations are shown in Appendix A.

Rainfall Data

The variation of rainfall volume with time was required as part of the storm input for the SCS Curve Number method. Therefore, the development of a design storm with a rainfall frequency and duration was necessary to compute the design hydrograph for the watershed. Rainfall data used in this study was obtained from the Technical Paper No. 42 (TP-42) [National Weather Service, 1961].

The rainfall event of 100-, 50-, 25-, 10 and 2-years frequency for many durations was used and are shown in Table 2. Rainfall for 5 and 15 minutes were estimated by regression analysis, details of these calculations are shown in Appendix A.

Table 2
Rainfall for 2, 10, 25, 50 y 100 years

Duration *Hrs.*	**Precipitation** *Inches*				
	2-yr	***10-yr***	***25-yr***	***50-yr***	***100-yr***
0.083	0.47	0.55	0.61	0.64	0.99
0.25	1.02	1.26	1.47	1.55	2.15
1	2.10	3.00	3.50	3.80	4.40
2	2.50	3.70	4.50	5.00	5.20
3	2.70	4.10	5.10	5.20	6.10
6	3.30	5.40	6.30	7.00	8.00
12	4.00	6.60	7.70	8.70	9.70
24	4.60	7.60	9.40	10.50	11.50

Depth-Area Adjustment

Point rainfall estimates obtained from the TP-42 represent values for areas up to 10 mi^2; therefore, a depth-area adjustment should be applied to the rainfall data when the watershed area is greater. In this case, the largest watershed consists of 0.868 mi^2. Hence, this adjustment was not applied.

Time Distribution of Rainfall

The triangular type methodology was used to distribute the rainfall depth in time. This method is considered acceptable for small areas.

Rainfall Extraction

Rainfall extraction such as vegetative interception, depressional storage, and infiltration were estimated using the SCS's Runoff Curve Number method. Though this method is used to predict runoff volume directly, the rainfall extraction is incorporated in the model as function of the curve number of the watershed.

Hydrologic Analysis Results

Hydrologic analysis was made for all the drainage areas. Individual and composite runoff hydrographs were obtained using HEC-1 methodology. Table 3 shows the summary of the results for this analysis. Input and output data for the HEC-1 model for existing and proposed condition are included in Appendix B and C, respectively.

IV. RUNOFF MITIGATION ANALYSIS

The development of the site will increase the runoff discharge. The Puerto Rico Planning Board Regulation No. 3 requires a flow mitigation structure wherever an increase in discharge is produced. Therefore, detention structures that will mitigate the overall increase in runoff discharge were used.

Approach

The discharge from areas P1, P2, P4 and P7 has shown increase. They will be provided by detention ponds. These ponds will reduce the combined peak discharge of the project drainage areas to magnitudes below the discharge at existing condition. Three detention ponds were evaluated in the study. Areas P1 and P7 will be combined and mitigated in one single detention pond. Pond-2 will be located to the east of Area P2. Pond-1 which serves P7 and part of P1 will be located to the west of area P7 and Pond-4 to the south east of area P4. See Figure 8.

Methodology

The computer program HEC-1 provides means for routing a hydrograph through detention structures. The purpose of detention is that the proposed condition peak discharge does not exceed the existing condition peak discharge.

Depth-Volume Relations

Volume-depth relations were developed for the ponds. Pond-1 which serves areas P1 and P7 is provided with a 3,010 -square meter base area; Pond-2 with a 1,228-square-meter base area and Pond-4 with a 1124-square-meter base area. Bank slopes for both ponds area 2H:1V. Volume-Depth curve computations are included in Appendix D.

Flow Rating

Flow-Depth relation for the detention Pond-1 was estimated considering the discharge through

two (2) 2.5'-diameter orifices located at the bottom of the pond, two (2) 3.5'- diameter orifice located at the 1.5m above the bottom of the pond, and a 6.10-meter long weir at 2.70 meters above the pond bottom. For the detention Pond-2, flow was estimated considering the discharge through a 3.0' -diameter orifice located at the bottom of the pond and a 9.14-meter long weir at 2.80 meter above the pond bottom . Flow for Pond-4 was rated considering the discharge through one (1) 0.8' -diameter orifice located at the bottom of the pond, one (1) 3'- diameter orifice located at the 1.5 m bottom, and a 7.92-meter long weir at 2.70 meter abover the pond bottom. Flow through the orifices was computed using Torrecelli's formula. Appendix D shows the computations for the flow-depth relationship and the curves.

Results

The results of the detention analysis show that the proposed detention ponds provide appropriate runoff mitigation for the 100-year frequency discharges. Routing the discharge through the detention Pond-1, the 100-year discharge was reduced from 326 cfs to 289 cfs, which is less than the discharge computed for existing condition, 320 cfs. At Pond 2, the 100-year discharge was reduced from 214 cfs to 159 cfs, which is less than the discharge computed for existing condition, 194 cfs. At Pond 4, the 100-year discharge was reduced from 291 cfs to 247 cfs., which is less than the discharge computed for existing condition, 285 cfs; thus complying with the Puerto Rico Planning Board Regulation No.3. Mitigation for more recurrent discharges was also verified.

Input and output data for the HEC-1 mitigation model are included in Appendix E. Table 4 shows the comparison of the discharges for existing, proposed and mitigation condition.

Mitigation Structure Dimensions and Accessories

Final dimensions for the detention pond will include a minimum free board of 0.60 meters. The detention pond will have the characteristics shown in Table 5.

Table 5
Retention Pond Characteristics

Pond1	Dimensions	Bottom Area	3010 m^2
		Height	3.48 m
	Outlet Control	Orifice @ bottom	Two-2.5'Diameter
		Orifice @ 1.5 m bottom	Two-2.8'Diameter
		Weir Length @ 2.70m	6.09 m
Pond2	Dimensions	Bottom Area	1229 m^2
		Height	3.62 m
	Outlet Control	Orifice @ bottom	One-3.0'Diameter
		Weir Length @ 2.8m	9.14 m
Pond4	Dimensions	Bottom Area	1124 m^2

		Height	3.36 m
	Outlet Control	Orifice @ bottom	One-0.8'Diameter
		Orifice @ 1.50m bottom	One-3.0'Diameter
		Weir Length @ 2.70m	7.92 m

Schematic layout of the detention system is presented in Figures 9, 10 and 11 for Pond 1, Pond 2, and Pond 4, respectively.

Pond Discharge

The pond outlet must be able to take the total discharge from the pond. Two-60"-diameter pipe was estimated for Pond-1, a 66"-diameter pipe for Pond-2, a 48"-diameter pipe for Pond-4. Both ponds will discharge over the 100-year water surface elevation.

V. HYDRAULIC ANALYSIS

A hydraulic analysis was made for the three watercourses running across the site. None of them will be affected by the development except to the extent needed for the road crossing structures. The main watercourse is Quebrada Hicatea (WC-1). The second watercourse (WC-2) is a tributary to the main, to which it merges just at its exit from the site. The third watercourse (WC-3) is located at the west of the site and runs across drainage area P3.

The hydraulic analysis was made in order to find the 100-year water surface elevation; so that the development is constructed above this elevation and outside of the 100-year flood footprint.

The hydraulic analysis was made using the mathematical model HEC-RAS developed by the US Corps of Engineers. For this model, the hydraulic regime is steady, uniform, and one-dimensional. The model accepts changes in the geometry of the watercourse, bank-bed-overbank friction coefficient and shapes of hydraulic structures.

The friction coefficient used in the modeling was obtained from visual inspection of the watercourses bed and banks; and crosschecked with the typical values provided by Barnes (1967) and Chow (1959).

Cross sections for the creek were taken from the fieldwork provided. This fieldwork is shown in Appendix H. Figure 12 depicts the location of the cross sections.

Roughness

Manning coefficients estimated for the model are 0.013 for concrete, 0.045 for the channel. These values reflect the changes in direction and the irregular shape of the channel bed, and the vegetation present in the courses.

Contraction and Expansion Coefficients

Coefficients of contraction and expansion used are those recommended by the HEC-RAS user's manual. Thus, coefficients of 0.1 and 0.3 respectively were used for gradual transitions.

Starting Water Surface Elevation

Slope area method was applied for starting the subcritical run. For the supercritical run, critical depth was adopted.

Hydraulics for Existing Condition

The existing condition corresponds to the water courses as they presently are, without any modification. The location of them is shown in Figure 12, where the cross sections are located.

The hydraulic analysis was based on discharges obtained by the hydrologic analysis. Flow regime at the existing condition as well as for the proposed condition was assumed to be mixed: subcritical in some segments and supercritical in others.

The computer output for the existing condition is included in Appendix F. The following Table 6 includes the summary of the results for watercourse.

Table 6

Hydraulics for Proposed Condition

No major alterations onto the watercourses are projected at proposed condition. The geometry of these watercourses is kept the same as that of the existing condition except at the road crossings, in which minor modifications are necessary for the bridge abutments. Four (4) crossing structures are considered. Bridge-1 and Bridge-2, with 11-meter span each, will be located at the Quebrada Hicatea (WC-1). A 10-meter span Bridge-3 is proposed for WC-2, and 3.65-meter span Bridge-4 for WC-3. Figures 14 to 17 show the dimensions of these bridges.

The computer output for the hydraulics analysis is included in Appendix G. The following Tables 7 include the summary of the results for watercourse

Table 7

Results

The maximum increase in floodwater levels due to a hydraulic structure allowed by the Puerto Rico Planning Board Regulation No. 13 for rural areas is 0.30 meters. There is no increase in water level at the cross section located in the immediate upstream of the project site. The water level increase caused by the bridges is bellow the limit established by Regulation No. 13.

Using the results of the hydraulics analysis, the 100-year floodplain was delineated, as shown in Figure 13. No construction will take place in the floodplain.

Local Storm Sewer System

The design engineer must convey the discharge form all areas though pipes and surface runoff over the roadways to the watercourses.

V. CONCLUSIONS AND RECOMMENDATIONS

The following are the conclusions of this study:

1. The development of the site increases the peak discharge at drainage areas P1, P2, P4 and P7. Runoff mitigation structures are needed as per the PR Planning Board Regulation No. 3.

2. The proposed mitigation structures reduce the increment in discharge due to the development to levels lower that those of the existing condition.

3. The 100-year floodplain footprint determined for the three storm watercourses will not be affected by the development. The development will be erected outside of this floodplain.

The following are the recommendations of this study:

1. The project site's roadway elevation must be at least 2 ft above the local flood water levels as determined in this study. But the minimum roadway elevation at the road crossing structure will be determined taking into consideration that the bridge low cord will be at least 0.60 meters above the 100-year water elevation. An in the vicinity of the detention ponds, the minimum roadway elevation will be 0.60 meters above the 100-year water elevation at the pond.

2. The size, location and point of discharge of the runoff mitigation structures will be as indicated in this study. The ponds will have an outlet control as described in the Table 5 of this study.

3. The engineer will make sure that the site be graded in a way that the magnitude of the drainage areas be as assumed in this study.

4. Collection discharge pipes for cloistered drainage areas must be designed for a 100-year discharge.

5. The minimum free board for the bridges will be of 0.60 meters.

6. The engineer will include protection from erosion at the discharge of the detention ponds. Protection may be by rip-rap or gabions.

7. Maintenance of the road crossing culverts and mitigation pond outlet is necessary during operation. Maintenance shall consist on keeping the entrance free from clogging debris or vegetation.

Study Limits

All the recommendations specified in this study must be considered to assure the optimum performance of the proposed structures operation. The design engineer will be responsible for elaborating the drawings in conformance with the recommendations of this study.

The results of this study are based on free flow conditions through the hydraulic structures. Proper maintenance must be developed to assure this condition. On the event of the occurrence of any severe obstruction to the flow, the results and recommendations may be impaired. Finally, the design engineer must use results and recommendations included in this report only and exclusively for the intended purposes as indicated in this study.

```

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.
THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION
NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

PROJECT DATA
Project Title: Monte Arenas Development
Project File : MonteArenas.prj
Run Date and Time: 1/28/2006 4:52:27 PM

Project in SI units

PLAN DATA

Plan Title: existing-condition
Plan File : p:\297-Monte Areas Development\hec-ras\MonteArenas.p01

Geometry Title: existing-condition
Geometry File : p:\297-Monte Areas Development\hec-ras\MonteArenas.g01

Flow Title : existing-condition
Flow File : p:\297-Monte Areas Development\hec-ras\MonteArenas.f01

Plan Summary Information:

Number of:	Cross Sections	= 15	Multiple Openings	=	0
	Culverts	= 0	Inline Structures	=	0
	Bridges	= 0	Lateral Structures	=	0

Computational Information
Water surface calculation tolerance = 0.003
Critical depth calculaton tolerance = 0.003
Maximum number of interations = 20
Maximum difference tolerance = 0.1
Flow tolerance factor = 0.001

Computation Options
Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Mixed Flow

C & E Loss (m)	0.05				

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: Divided flow computed for this cross-section.
Warning: The cross-section end points had to be extended vertically for the computed water surface.
Warning: The energy loss was greater than 1.0 ft (0.3 m), between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Plan Summary Information:

Number of:	Cross Sections	= 3	Mulitple Openings	=	0
	Culverts	= 0	Inline Structures	=	0
	Bridges	= 0	Lateral Structures	=	0

putational Information
Water surface calculation tolerance = 0.003
Critical depth calculaton tolerance = 0.003
Maximum number of interations = 20
Maximum difference tolerance = 0.1
Flow tolerance factor = 0.001

Computation Options
Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Mixed Flow

PROJECT DATA
Project Title: Monte Arenas Development
Project File : MonteArenas.prj
Run Date and Time: 1/28/2006 4:15:39 PM

Project in SI units

PLAN DATA

Plan Title: proposed-condition
Plan File : p:\297-Monte Areas Development\hec-ras\MonteArenas.p02

Geometry Title: proposed-condition
Geometry File : p:\297-Monte Areas Development\hec-ras\MonteArenas.g02

Flow Title : proposed-condition
Flow File : p:\297-Monte Areas Development\hec-ras\MonteArenas.f02

Plan Summary Information:

Number of:	Cross Sections	= 15	Multiple Openings	=	0
	Culverts	= 0	Inline Structures	=	0
	Bridges	= 3	Lateral Structures	=	0

Computational Information
Water surface calculation tolerance = 0.003
Critical depth calculaton tolerance = 0.003
Maximum number of interations = 20
Maximum difference tolerance = 0.1
Flow tolerance factor = 0.001

Computation Options
Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Mixed Flow

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
[illegible]ing: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.
Note: Multiple critical depths were found at this location. The critical depth with the lowest, valid, water surface was used.

Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Note: Hydraulic jump has occurred between this cross section and the previous upstream section.

Warning: For the final momentum answer at the bridge, the upstream energy was computed lower than the

downstream energy. This is not physically possible, the momentum answer has been disregarded.
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Note: The energy method has computed a class B profile.

ning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than

0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Warning: The energy loss was greater than 1.0 ft (0.3 m). between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

Run Date and Time: 1/20/2006 4:57:48 PM

Project in SI units

PLAN DATA

Plan Title: proposed-condition-creek2
Plan File : p:\297-Monte Areas Development\hec-ras\MonteArenas.p04

Geometry Title: proposed-condition-creek2
Geometry File : p:\297-Monte Areas Development\hec-ras\MonteArenas.g04

Flow Title : proposed-condition-creek2
Flow File : p:\297-Monte Areas Development\hec-ras\MonteArenas.f04

Plan Summary Information:

Number of:	Cross Sections =	4	Mulitple Openings =	0
	Culverts =	0	Inline Structures =	0
	Bridges =	1	Lateral Structures =	0

Computational Information
Water surface calculation tolerance = 0.003
Critical depth calculaton tolerance = 0.003
Maximum number of interations = 20
Maximum difference tolerance = 0.1
Flow tolerance factor = 0.001

Computation Options
Critical depth computed only where necessary
Conveyance Calculation Method: At breaks in n values only
Friction Slope Method: Average Conveyance
Computational Flow Regime: Mixed Flow

Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.
Warning: The energy loss was greater than 1.0 ft (0.3 m), between the current and previous cross section. This may indicate the need for additional cross sections.
Warning: During the standard step iterations, when the assumed water surface was set equal to critical depth, the calculated water surface came back below critical depth. This indicates that there is not a valid subcritical answer. The program defaulted to critical depth.

BR Open Area (m2)	4.79	C & E Loss (m)		0.00
BR Open Vel (m/s)	2.58	Shear Total (N/m2)	150.49	150.49
Coef of Q		Power Total (N/m s)	388.26	388.26
Br Sel Method	Energy only			

Warning: For the final momentum answer at the bridge, the upstream energy was computed lower than the downstream energy. This is not physically possible, the momentum answer has been disregarded.
Warning: The energy equation could not be balanced within the specified number of iterations. The program used critical depth for the water surface and continued on with the calculations.

CROSS SECTION

Conv. Total (m3/s)	13.1	Conv. (m3/s)	13.1
ngth Wtd. (m)		Wetted Per. (m)	9.32
n Ch El (m)	133.00	Shear (N/m2)	450.36
lpha	1.00	Stream Power (N/m s)	1627.22
Frctn Loss (m)	0.03	Cum Volume (1000 m3)	
C & E Loss (m)	0.03	Cum SA (1000 m2)	

Warning: The velocity head has changed by more than 0.5 ft (0.15 m). This may indicate the need for additional cross sections.
Warning: The conveyance ratio (upstream conveyance divided by downstream conveyance) is less than 0.7 or greater than 1.4. This may indicate the need for additional cross sections.
Note: The energy method has computed a class B profile.

SUMMARY OF MANNING'S N VALUES

River:creek2

Reach	River Sta.	n1	n2	n3
one	14	.045	.045	.0456
